

The Most Accurate, Actionable and Accessible Security Ratings

Why SecurityScorecard?

It's the platform. It's the level of service. It's the underlying data. SecurityScorecard provides the knowledge of what to fix and why. We work closely with customers to show them how to act on security issues. The platform displays 10 actionable risk factors and helps customers make smart security decisions for their entire vendor and partner ecosystems.

Platform Performance

SecurityScorecard's intuitive user interface allows users to view and monitor security ratings, easily add vendors or partner organizations, and report on the cyberhealth of their ecosystems. Customers can access analytics, assess compliance with several frameworks, and use collaborative features and other tools that can help them better manage ecosystem security and meet compliance objectives. Customers can add vendors to their portfolios, which then gives these vendors free access to the company scorecard. Vendors can access risk factors and issues, and drill down into findings to visualize and understand severity, IP address, and much more. This provides a level of collaboration not available with any competitive solution.

Superior Service

After working with other vendors, customers point to SecurityScorecard's customer service as the number one reason for moving to the platform. SecurityScorecard's passionate Customer Success team strives to make sure that organizations and their vendor and partner ecosystems are collaborating well to gain maximum benefit from the platform and its underlying data.

The Best Data Available

It's the intelligence behind the score that matters most. Security ratings are only as good as the data and attribution that support them. SecurityScorecard data is gathered via nonintrusive collection techniques. And we're continuously adding new data sources; the most recent additions deliver more insights on Endpoint Security, Network Security, Patching Cadence, and IP Reputation (Malware and Spam). Owning a majority of the data and the collection process is essential for data validation, accurate attribution, and elimination of noise and false positives. No other competitor can make this claim.
